TasteMatch Trips

A fairness-aware group-travel agent on Qloo Taste AI

Agents, but with taste — and fairness.

Problem

Group trips fail on **taste**, not calendars.

- One friend: Spirited Away & Patagonia
- Another: Daft Punk & Wes Anderson
- Third: Anthony Bourdain & Chef's Table

Planners optimise for the **average** → someone quietly loses.
An LLM can *say* "something for everyone" — it can't **measure** it.

Solution: a fairness heuristic using Qloo scores

1. **Resolve** each favourite — `GET /search`
2. **Score cities** for the group, then for **each traveler** — `/v2/insights` + `filter.entities`
3. **Rank by fairness** — `40% mean + 40% least-happy + 20% group`
4. **Find stops** per traveler — place insights + `filter.location.query`
   (prefer visitable nearby places; original results may be used as a fallback)
5. **Request stop scores for every traveler** — a traveler × stop affinity matrix
6. **Plan → self-check → re-plan** — try to reduce gaps above 5 pts when scores are complete

What the agent decides (and shows)

- **Compensate:** the traveler the city fits least picks first
- **Group-aware picks:** with complete stop scores, choose among top-tier stops to lift whoever is furthest behind
- **Self-check:** if the enjoyment gap is > 5 pts and scores are complete, re-plan once; keep it only if it's fairer
- **Time of day:** cafés, sights and beaches by day; dinner, bars and clubs in the evening — never a club at 9 am
- **Limits:** missing scores are disclosed; city ranking assumes scores are comparable across travelers

Live result — hosted demo, re-checked 27 Oct 2026

Sample group Aziz / Malika / Rustam · all 6 favourites matched · 16 logged steps in ~4 s

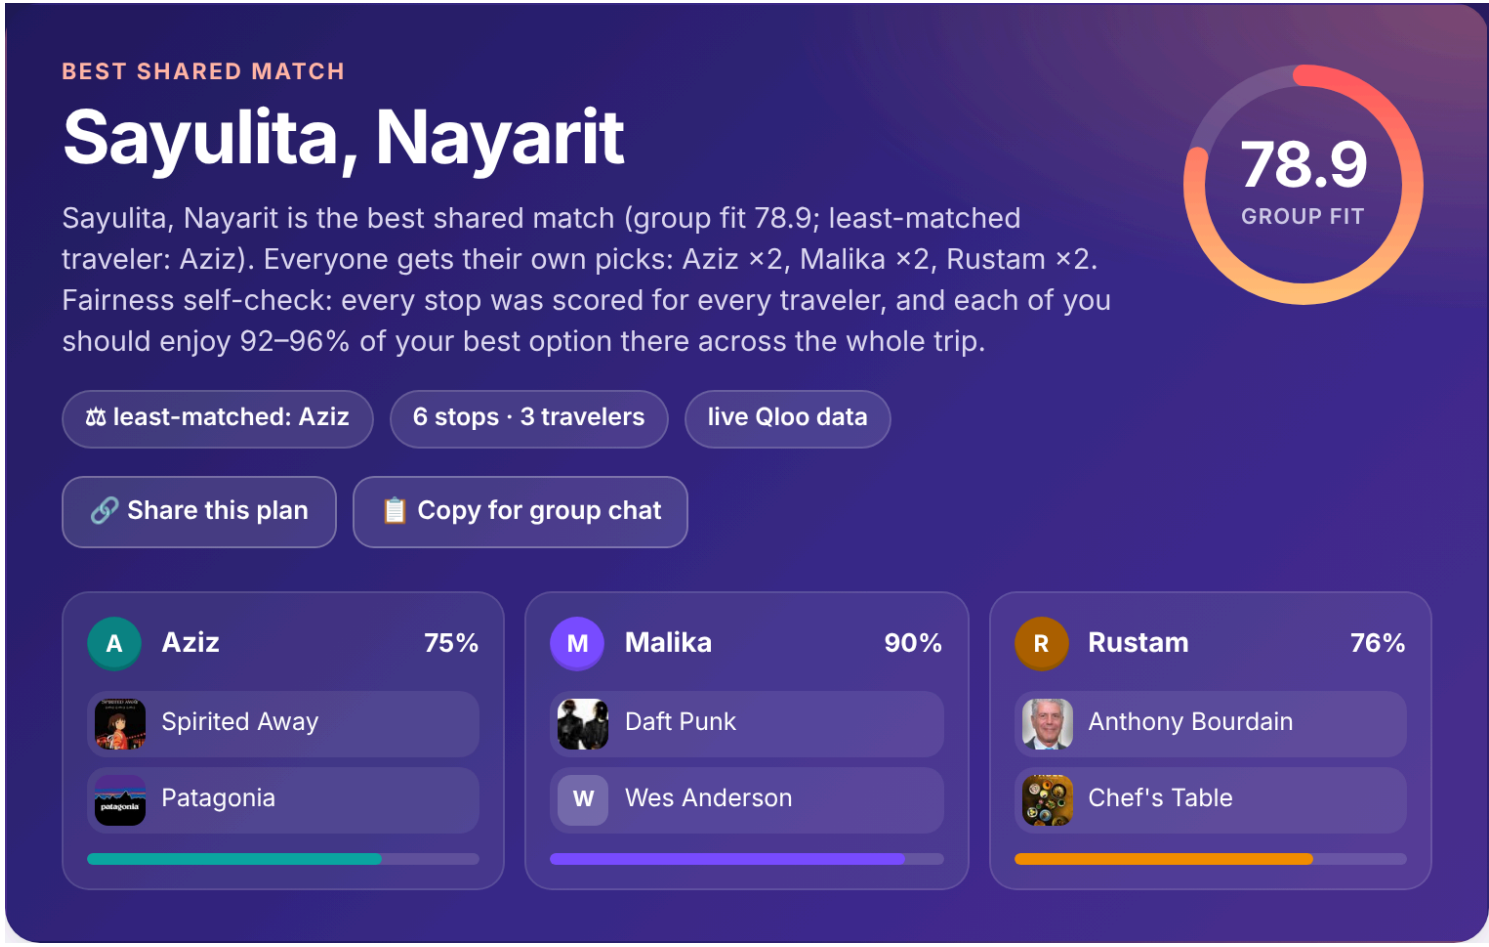

Rank	Destination	group_fit	least-matched
1	**Sayulita, Nayarit**	**78.9**	Aziz
2	Santa Fe, New Mexico	78.6	Malika
3	Ojai, California	77.4	Malika

Itinerary Aziz ×2 · Malika ×2 · Rustam ×2 — whole-trip enjoyment **92% · 93% · 96%** (gap 4 pts, 3 stops swapped)

Best shared match

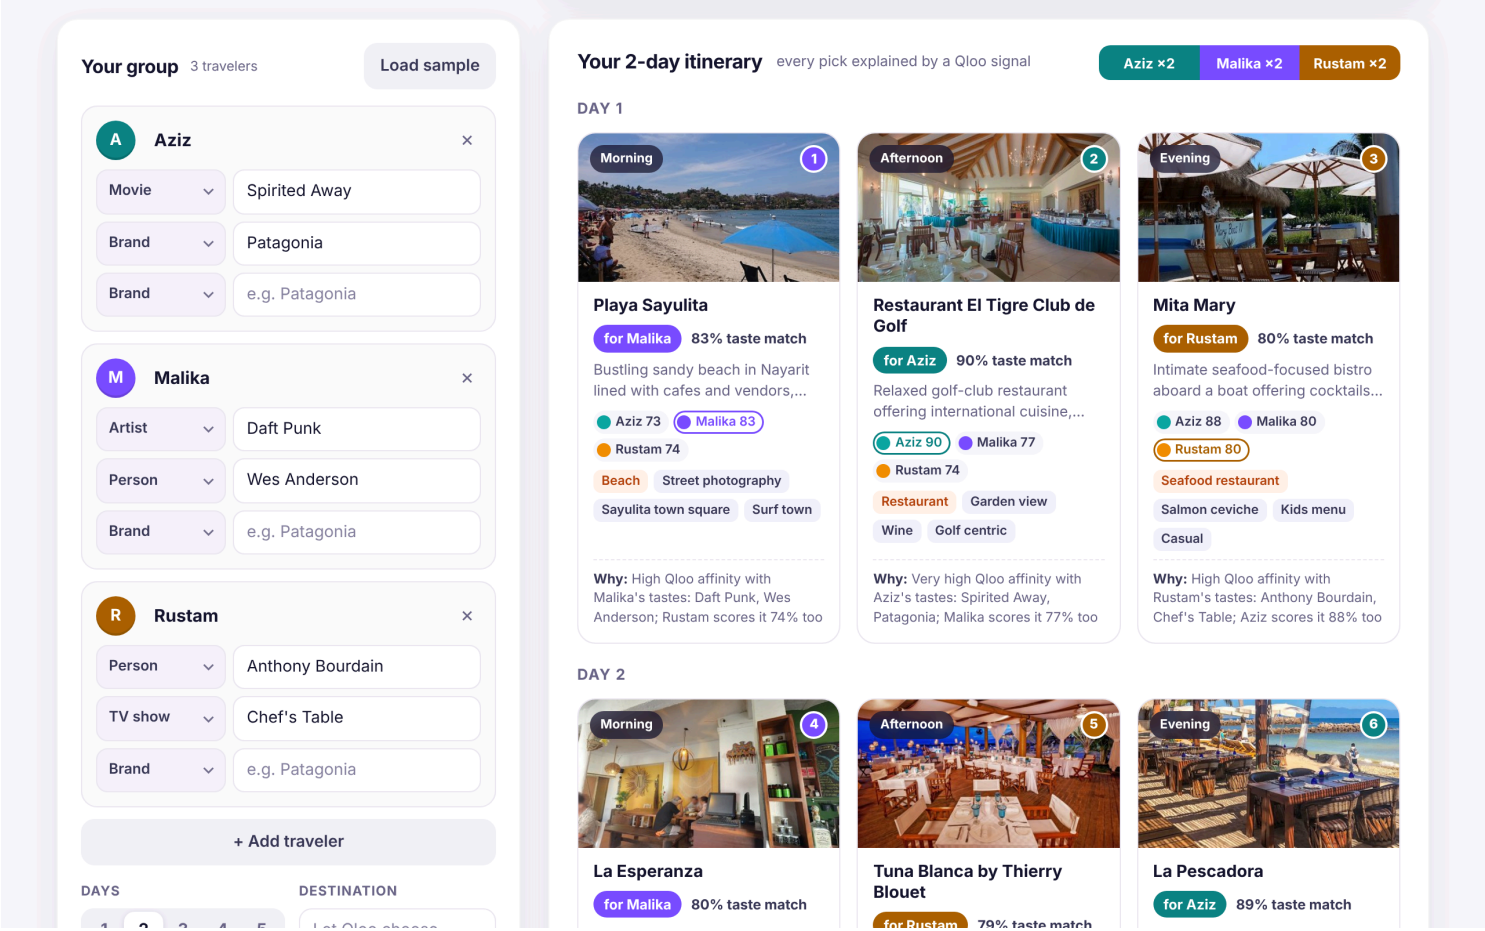

Group-fit ring, per-traveler fit, matched favourites with Qloo images.

Share this plan link + **Copy for group chat**.

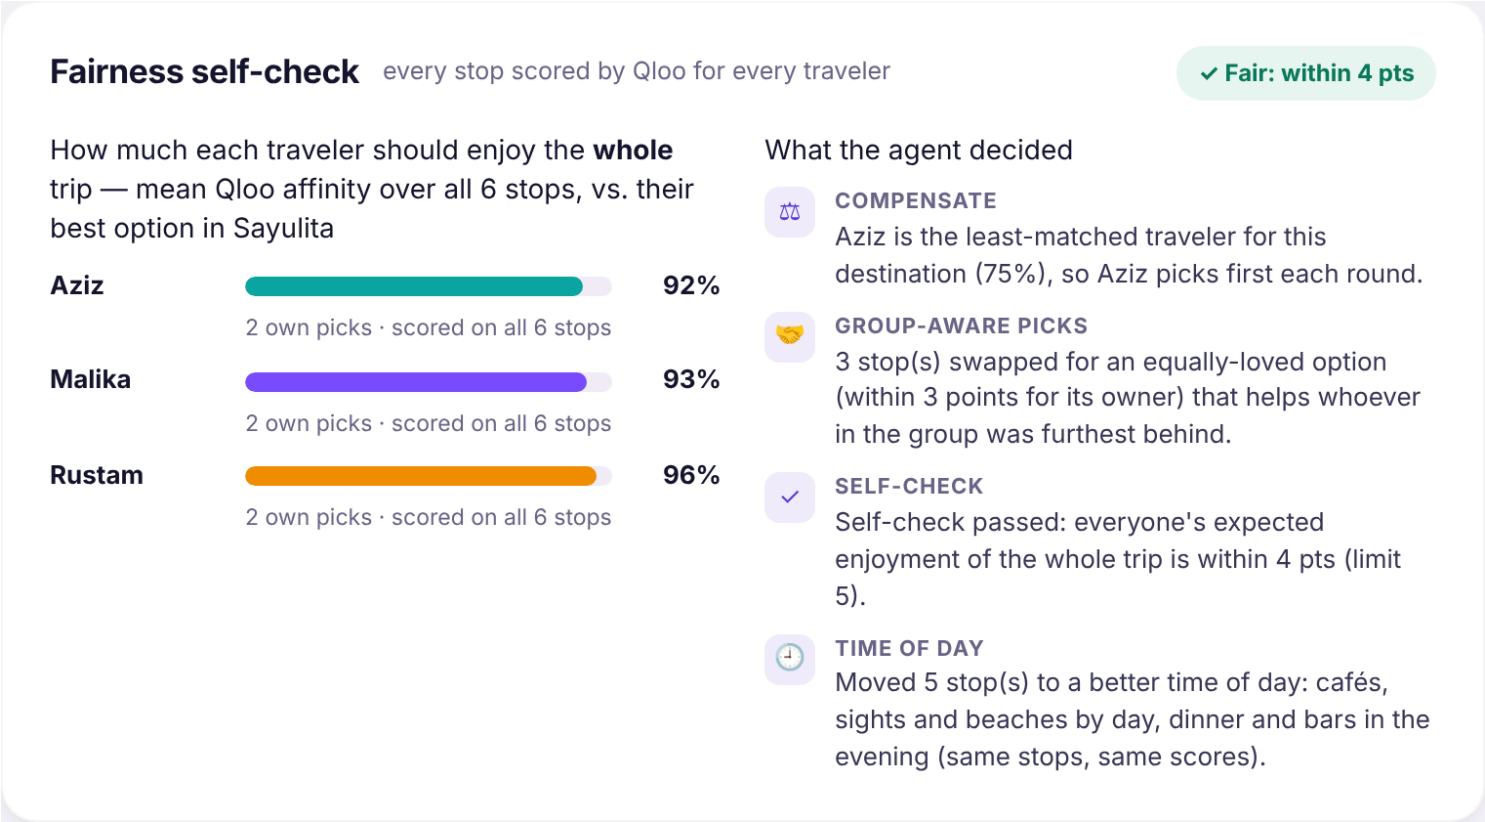

Recorded run: stop scores

Each card shows its owner, Qloo affinity, the favourites associated with that owner's pool, and available scores for other travelers.

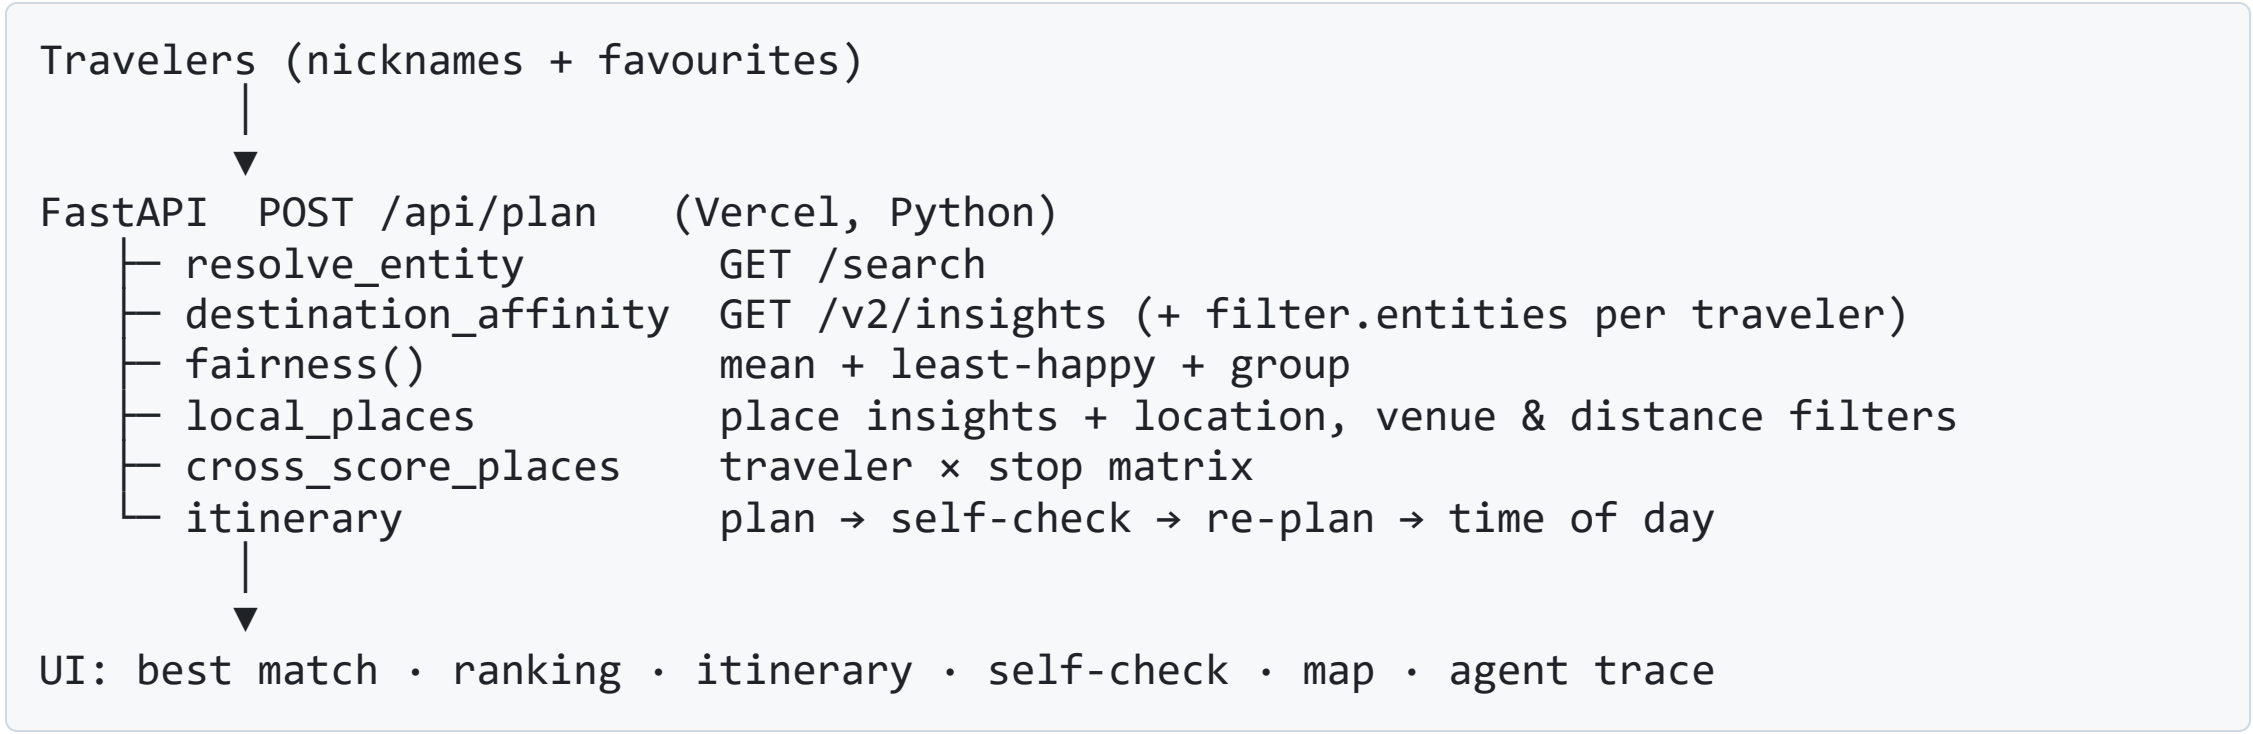

Fairness self-check

When candidate scores are complete, the agent checks whole-trip enjoyment and explains its decisions.

Architecture

Responsible use of Qloo

- Use **nicknames and public favourites**; typed favourites and destination are sent to Qloo
- Unmatched favourites are **surfaced**, never guessed
- The app's Qloo response cache is **in memory**
- Results labelled as **aggregate affinities**, not predictions about individuals
- The trace groups logical steps; retries and alternate searches are not all listed separately

What's next

1. `/v2/tags` vibe filters (beach / food / nightlife)
2. Budget and travel time alongside fairness
3. Group polls in Telegram (n8n workflow in the repo) to confirm the city
4. Local guides for Samarkand and Tashkent

Built with: Python · FastAPI · Qloo Taste AI (`/search` , `/v2/insights`) · Vercel · pytest · n8n
